

The kvoptions package

Heiko Oberdiek
<oberdiek@uni-freiburg.de>

2009/04/10 v3.1

Abstract

This package is intended for package authors who want to use options in key value format for their package options.

1 Introduction

1.1 The beginning

This package addresses class or package writers that want to allow their users to specify options as key value pairs, e.g.:

```
\documentclass[verbose=false,name=me]{myclass}
\usepackage[format=print]{mylayout}
```

Prominent example is package `hyperref`, probably the first package that offers this service. It's `\ProcessOptionsWithKV` is often copied und used in other packages, e.g. package `helvet` that uses this interface for its option `scaled`.

However copying code is not the most modern software development technique. And `hyperref`'s code for `\ProcessOptionsWithKV` was changed to fix bugs. The version used in other packages depends on the time of copying and the awareness of `hyperref`'s changes. Now the code is sourced out into this package and available for other package or class writers.

1.2 Overview

Package `kvoptions` connects package `keyval` with L^AT_EX's package and class `options`:

Package <code>keyval</code>	Package <code>kvoptions</code>	L ^A T _E X kernel
<code>\define@key</code>	<code>\DeclareVoidOption</code> <code>\DeclareStringOption</code> <code>\DeclareBoolOption</code> <code>\DeclareComplementaryOption</code> <code>\DisableKeyvalOption</code>	<code>\DeclareOption</code>
	<code>\DeclareDefaultOption</code>	<code>\DeclareOption*</code>
	<code>\ProcessKeyvalOptions</code>	<code>\ProcessOptions*</code>
	Option patch	Class/package option system
	<code>\SetupKeyvalOptions</code>	

2 Usage

2.1 Process options

2.1.1 `\ProcessKeyvalOptions`

```
\ProcessKeyvalOptions{⟨family⟩}
\ProcessKeyvalOptions*
```

This command evaluates the global or local options of the package that are defined with `keyval`'s interface within the family `⟨family⟩`. It acts the same way as L^AT_EX's `\ProcessOptions*`. In a package unknown global options are ignored, in a class they are added to the unknown option list. The known global options and all local options are passed to `keyval`'s `\setkeys` command for executing the options. Unknown options are reported to the user by an error.

If the family name happens to be the same as the name of the package or class where `\ProcessKeyvalOptions` is used or the family name has previously been setup by `\SetupKeyvalOptions`, then `\ProcessKeyvalOptions` knows the family name already and you can use the star form without mandatory argument.

Neither of the following macros are necessary for `\ProcessKeyvalOptions`. They just help the package/class author in common tasks.

2.1.2 `\SetupKeyvalOptions`

```
\SetupKeyvalOptions{
  family=⟨family⟩,
  prefix=⟨prefix⟩
}
```

This command allows to configure the default assumptions that are based on the current package or class name. L^AT_EX remembers this name in `\@currname`. The syntax description of the default looks a little weird, therefor an example is given for a package or class named `foobar`.

Key	Default	(example)	Used by
family	<code>\@currname</code>	(foobar)	<code>\ProcessKeyvalOptions*</code> <code>\DeclareBoolOption</code> <code>\DeclareStringOption</code>
prefix	<code>\@currname</code> @	(foobar@)	<code>\DeclareBoolOption</code> <code>\DeclareStringOption</code> <code>\DeclareVoidOption</code>

2.2 Option declarations

The options for `\ProcessKeyvalOptions` are defined by `keyval`'s `\define@key`. Common purposes of such keys are boolean switches, they enable or disable something. Or they store a name or some kind of string in a macro. The following commands help the user. He declares what he wants and `kvoptions` take care of the key definition, resource allocation and initialization.

In order to avoid name clashes of macro names, internal commands are prefixed. Both the prefix and the family name for the defined keys can be configured by `\SetupKeyvalOptions`.

2.2.1 `\DeclareStringOption`

`\DeclareStringOption [<init>] {<key>} [<default>]`

A macro is created that remembers the value of the key *<key>*. The name of the macro consists of the option name *<key>* that is prefixed by the prefix (see 2.1.2). The initial contents of the macro can be given by the first optional argument *<init>*. The default is empty.

The option *<key>* is defined. The option code just stores its value in the macro. If the optional argument at the end of `\DeclareStringOption` is given, then option *<key>* is defined with the default *<default>*.

Example for a package with the following two lines:

```
\ProvidesPackage{foobar}
\DeclareStringOption[me]{name}
```

Then `\DeclareStringOption` defines the macro with content `me`, note `LATEX` complains if the name of the macro already exists:

```
\newcommand*\foobar@name{me}
```

The option definition is similar to:

```
\define@key{foobar}{name}{%
  \renewcommand*\foobar@name{#1}%
}
```

2.2.2 `\DeclareBoolOption`

`\DeclareBoolOption [<init>] {<key>}`

A boolean switch is generated, initialized by value *<init>* and the corresponding key *<key>* is defined. If the initialization value is not given, `false` is used as default.

The internal actions of `\DeclareBoolOption` are shown below. The example is given for a package author who has the following two lines in his package/class:

```
\ProvidesPackage{foobar}
\DeclareBoolOption{verbose}
```

First a new switch is created:

```
\newif\iffoobar@verbose
```

and initialized:

```
\foobar@verbosefalse
```

Finally the key is defined:

```
\define@key{foobar}{verbose}[true]{...}
```

The option code configures the boolean option in the following way: If the author specifies **true** or **false** then the switch is turned on or off respectively. Also the option can be given without explicit value. Then the switch is enabled. Other values are reported as errors.

Now the switch is ready to use in the package/class, e.g.:

```
\iffobar@verbose
% print verbose message
\else
% be quiet
\fi
```

Users of package `\ifthen` can use the switch as boolean:

```
\boolean{foobar@verbose}
```

2.2.3 \DeclareComplementaryOption

`\DeclareComplementaryOption{<key>}{<parent>}`

Sometimes contrasting names are used to characterize the two states of a boolean switch, for example **draft** vs. **final**. Both options behave like boolean options but they do not need to different switches, they should share one. `\DeclareComplementaryOption` allows this. The option `<key>` shares the switch of option `<parent>`. Example:

```
\DeclareBoolOption{draft}
\DeclareComplementaryOption{final}{draft}
```

Then **final** sets the switch of **draft** to **false**, and **final=false** enables the **draft** switch.

2.2.4 \DeclareVoidOption

`\DeclareVoidOption{<key>}{<code>}`

`\ProcessKeyvalOptions` can be extended to recognize options that are declared in traditional way by `\DeclareOption`. But in case of the error that the user specifies a value, then this option would not be recognized as key value option because of `\DeclareOption` and not detected as traditional option because of the value part. The user would get an unknown option error, difficult to understand.

`\DeclareVoidOption` solves this problem. It defines the option `<key>` as key value option. If the user specifies a value, a warning is given and the value is ignored.

The code part `<code>` is stored in a macro. The name of the macro consists of the option name `<key>` that is prefixed by the prefix (see 2.1.2). If the option is set, the macro will be executed. During the execution `\CurrentOption` is available with the current key name.

2.2.5 \DeclareDefaultOption

`\DeclareDefaultOption{⟨code⟩}`

This command does not define a specific key, it is the equivalent to L^AT_EX's `\DeclareOption*`. It allows the specification of a default action `⟨code⟩` that is invoked if an unknown option is found. While `⟨code⟩` is called, macro `\CurrentOption` contains the current option string. In addition `\CurrentOptionValue` contains the value part if the option string is parsable as key value pair, otherwise it is `\relax`. `\CurrentOptionKey` contains the key of the key value pair, or the whole option string, if it misses the equal sign.

Inside packages typical default actions are to pass unknown options to another package. Or an error message can be thrown by `\@unknownoptionerror`. This is the original error message that L^AT_EX gives for unknown package options. This error message is easier to understand for the user as the error message from package `keyval` that is given otherwise.

A Class ignores unknown options and puts them on the unused option list. Let L^AT_EX do the job and just call `\OptionNotUsed`. Or the options can be passed to another class that is later loaded.

2.2.6 Dynamic options

Options of L^AT_EX's package/class system are cleared in `\ProcessOptions`. They modify the static model of a package. For example, depending on option `bookmarks` package `hyperref` loads differently.

Options, however, defined by `keyval`'s `\define@key` remain defined, if the options are processed by `\setkeys`. Therefore these options can also be used to model the dynamic behaviour of a package. For example, in `hyperref` the link colors can be changed everywhere until the end in `\end{document}`.

However package `color` that adds color support is necessary and it cannot be loaded after `\begin{document}`. Option `colorlinks` that loads `color` should be active until `\begin{document}` and die in some way if it is too late for loading packages. With `\DisableKeyvalOption` the package/class author can specify and configure the death of an option and controls the life period of the option.

2.2.7 \DisableKeyvalOption

`\DisableKeyvalOption [⟨options⟩] {⟨family⟩} {⟨key⟩}`

`⟨options⟩`:

<code>action</code>	<code>= undef, warning, error, or ignore</code>	default: <code>undef</code>
<code>global or local</code>		default: <code>global</code>
<code>package or class = ⟨name⟩</code>		

`\DisableKeyvalOption` can be called to mark the end when the option `⟨key⟩` is no longer useful. The behaviour of an option after its death can be configured by action:

undef: The option will be undefined, If it is called, `\setkeys` reports an error because of unknown key.

error or warning: Use of the option will cause an error or warning message. Also these actions require that exclusively either the package or class name is given in options `package` or `class`.

ignore: The use of the option will silently be ignored.

The option's death can be limited to the end of the current group, if option `local` is given. Default is `global`.

The package/class author can wish the end of the option already during the package loading, then he will have static behaviour. In case of dynamic options `\DisableKeyvalOptions` can be executed everywhere, also outside the package. Therefore the family name and the package/class name is usually unknown for `\DisableKeyvalOptions`. Therefore the argument for the family name is mandatory and for some actions the package/class name must be provided.

Usually a macro would configure the option death, Example:

```
\ProvidesPackage{foobar}
\DeclareBoolOption{color}
\DeclareStringOption[red]{emphcolor}
\ProcessKeyvalOptions*

\newcommand*{\foobar@DisableOption}[2]{%
  \DisableKeyvalueOption[
    action={#1},
    package=foobar
  ]{foobar}{#2}%
}

\iffobar@color
  \RequirePackage{color}
  \renewcommand*{\emph}[1]{\textcolor{\foobar@emphcolor}{#1}}
\else
  % Option emphcolor is not wrong, if we have color support.
  % otherwise the option has no effect, but we don't want to
  % remove it. Therefore action 'ignore' is the best choice:
  \foobar@DisableOption{ignore}{emphcolor}
\fi
% No we don't need the option 'color'.
\foobar@DisableOption{warning}{color}

% With color support option 'emphcolor' will dynamically
% change the color of \emph statements.
```

2.3 Summary of internal macros

The `\Declare...Option` commands define macros, additionally to the macros generated by the key definition. These macros can be used by the package/class author. The name of the macros starts with the prefix `\<prefix>` that can be configured by `\SetupKeyvalOptions`.

Declare <i><key></i>	Defined macro	Description
<code>\DeclareStringOption</code>	<code>\<prefix>\<key></code>	holds the string
<code>\DeclareBoolOption</code>	<code>\if\<prefix>\<key></code> <code>\<prefix>\<key>false</code> <code>\<prefix>\<key>true</code>	boolean switch disable switch enable switch
<code>\DeclareComplementaryOption</code>	<code>\<prefix>\<key>false</code> <code>\<prefix>\<key>true</code>	enable parent switch disable parent switch
<code>\DeclareVoidOption</code>	<code>\<prefix>\<key></code>	holds the action

2.4 plain-TeX

Package `keyval` is also usable in plain-TeX with the help of file `miniltx.tex`. Some features of this package `kvoptions` might also be useful for plain-TeX. If `LATeX` is not found, `\ProcessKeyvalOptions` and option `patch` are disabled. Before using the option declaration commands `\Declare...Option`, `\SetupKeyvalOptions` must be used.

3 Example

The following example defined a package that serves some private color management. A boolean option `print` enables print mode without colors. An option `emph` redefines `\emph` to print in the given color. And the driver can be specified by option `driver`.

```
1 \<example>
2   % Package identification
3   % -----
4 \NeedsTeXFormat{LaTeX2e}
5 \ProvidesPackage{example-mycolorsetup}[2009/04/10 Managing my colors]
6
7 \RequirePackage{ifpdf}
8 \RequirePackage{kvoptions}
9
10  % Option declarations
11  % -----
12
13 \SetupKeyvalOptions{
14   family=MCS,
15   prefix=MCS@
16 }
17   % Use a shorter family name and prefix
18
19   % Option print
20 \DeclareBoolOption{print}
21   % is the same as
22   % \DeclareBoolOption[false]{print}
23
24   % Option driver
25 \ifpdf
26   \DeclareStringOption[pdftex]{driver}
27 \else
28   \DeclareStringOption[dvips]{driver}
29 \fi
30
31   % Alternative interface for driver options
32 \DeclareVoidOption{dvips}{\SetupDriver}
33 \DeclareVoidOption{dvipdfm}{\SetupDriver}
34 \DeclareVoidOption{pdftex}{\SetupDriver}
35   % In \SetupDriver we take the current option \CurrentOption
36   % and pass it to the driver option.
37   % The \expandafter commands expand \CurrentOption at the
38   % time, when \SetupDriver is executed and \CurrentOption
39   % has the correct meaning.
40 \newcommand*{\SetupDriver}{%
41   \expandafter\@SetupDriver\expandafter{\CurrentOption}%
42 }
43 \newcommand*{\@SetupDriver}[1]{%
44   \setkeys{MCS}{driver={#1}}%
45 }
46
47   % Option emph
48   % An empty value means, we want to have no color for \emph.
49   % If the user specifies option emph without value, the red is used.
50 \DeclareStringOption{emph}[red]
51   % is the same as
52   % \DeclareStringOption[]{emph}[red]
53
54   % Default option rule
55 \DeclareDefaultOption{%
56   \ifx\CurrentOptionValue\relax
```

```

57 \PackageWarningNoLine{\@currname}{%
58   Unknown option '\CurrentOption'\MessageBreak
59   is passed to package 'color'%
60 }%
61 % Pass the option to package color.
62 % Again it is better to expand \CurrentOption.
63 \expandafter\PassOptionsToPackage
64 \expandafter{\CurrentOption}{color}%
65 \else
66   % Package color does not take options with values.
67   % We provide the standard LaTeX error.
68   \@unknownoptionerror
69 \fi
70 }
71
72 % Process options
73 % -----
74 \ProcessKeyvalOptions*
75
76 % Implementation depending on option values
77 % -----
78 % Code for print mode
79 \ifMCS@print
80   \PassOptionsToPackage{monochrome}{color}
81   % tells package color to use black and white
82 \fi
83
84 \RequirePackage[\MCS@driver]{color}
85 % load package color with the correct driver
86
87 % \emph setup
88 \ifx\MCS@emph\@empty
89   % \@empty is a predefined macro with empty contents.
90   % the option value of option emph is empty, thus
91   % we do not want a redefinition of \emph.
92 \else
93   \renewcommand*{\emph}[1]{%
94     \textcolor{\MCS@emph}{#1}%
95   }
96 \fi
97 \</example>

```

4 Package options

The package `kvoptions` knows two package options `patch` and `debugshow`. The options of package `kvoptions` are intended for authors, not for package/class writers. Inside a package it is too late for option `patch` and `debugshow` enables some messages that are perhaps useful for the debugging phase. Also \LaTeX is unhappy if a package is loaded later again with options that are previously not given. Thus package and class authors, stay with `\RequirePackage{kvoptions}` without options.

Option `patch` loads package `kvoptions-patch`.

4.1 Package `kvoptions-patch`

\LaTeX 's system of package/class options has some severe limitations that especially affects the value part if options are used as pair of key and value.

- Spaces are removed, regardless where:

```
\documentclass[box=0 0 400 600]{article}
```

Now each package will see `box=00400600` as global option.

- In the previous case also braces would not help:

```
\documentclass[box={0 0 400 600}]{article}
```

The result is an error message:

```
! LaTeX Error: Missing \begin{document}.
```

As local option, however, it works if the package knows about key value options (By using this package, for example).

- The requirements on robustness are extremely high. \LaTeX expands the option. All that will not work as environment name will break also as option. Even a `\relax` will generate an error message:

```
! Missing \endcsname inserted.
```

Of course, \LaTeX does not use its protecting mechanisms. On contrary `\protect` itself will cause errors.

- The options are expanded. But perhaps the package will do that, because it has to setup some things before? Example `hyperref`:

```
\usepackage[pdauthor=M\"uller]{hyperref}
```

Package `hyperref` does not see `M\"uller` but its expansion and it does not like it, you get many warnings

```
Token not allowed in a PDFDocEncoded string
```

And the title becomes: `Mu127uller`. Therefore such options must usually be given after package `hyperref` is loaded:

```
\usepackage{hyperref}
\hypersetup[pdauthor=Fran\c coise M\"uller]
```

As package option it will even break with `Fran\c coise` because of the cedilla `\c c`, it is not robust enough.

For users that do not want with this limitations the package offers option `patch`. It patches \LaTeX 's option system and tries to teach it also to handle options that are given as pairs of key and value and to prevent expansion. It can already be used at the very beginning, before `\documentclass`:

```
\RequirePackage[patch]{kvoptions}
\documentclass[pdauthor=Fran\c coise M\"uller]{article}
\usepackage{hyperref}
```

The latest time is before the package where you want to use problematic values:

```
\usepackage[patch]{kvoptions}
\usepackage[Fran\c coise M\"uller]{hyperref}
```

Some remarks:

- The patch requires $\varepsilon\text{-TeX}$, its `\unexpanded` feature is much to nice. It is possible to work around using token registers. But the code becomes longer, slower, more difficult to read and maintain. The package without option `patch` works and will work without $\varepsilon\text{-TeX}$.
- The code for the patch is quite long, there are many test cases. Thus the probability for bugs is probably not too small.

4.2 Option debugshow

The name of this option follows the convention of packages `multicol`, `tabularx`, and `tracefmt`. Currently it prints the setting of boolean options, declared by `\DeclareBoolOption` in the `.log` file, if that boolean option is used. You can activate the option by

- `\PassOptionsToPackage{debugshow}{kvoptions}`
Put this somewhere before package `kvoptions` is loaded first, e.g. before `\documentclass`.
- `\RequirePackage[debugshow]{kvoptions}`
Before `\documentclass` even an author has to use `\RequirePackage`. `\usepackage` only works after `\documentclass`.

The preferred method is `\PassOptionsToPackage`, because it does not force the package loading and does not disturb, if the package is not loaded later at all.

5 Limitations

5.1 Compatibility

5.1.1 Package `kvoptions-patch` vs. package `xkvltxp`

Package `xkvltxp` from the `xkeyval` project has the same goal as package `kvoptions-patch` and to patch \LaTeX 's kernel commands in order to get better support for key value options. Of course they cannot be used both. The user must decide, which method he prefers. Package `kvoptions-patch` aborts itself, if it detects that `xkvltxp` is already loaded.

However package `xkvltxp` and `kvoptions` can be used together, example:

```
\usepackage{xkvltxp}
\usepackage[...]{foobar} % foobar using kvoptions
```

The other way should work, too.

Package `kvoptions-patch` tries to catch more situations and to be more robust. For example, during the comparison of options it normalizes them by removing spaces around `=` and the value. Thus the following is not reported as option clash:

```
\RequirePackage{kvoptions-patch}
\documentclass{article}

\usepackage[scaled=0.7]{helvet}
\usepackage[scaled = 0.7]{helvet}

\begin{document}
\end{document}
```

5.2 Limitations

5.2.1 Option comparisons

In some situations \LaTeX compares option lists, e.g. option clash check, `\@ifpackagewith`, or `\@ifclasswith`. Apart from catcode and sanitizing problems of option patch, there is another problem. \LaTeX does not know about the type and default values of options in key value style. Thus an option clash is reported, even if the key value has the same meaning:

```
\usepackage[scaled]{helvet} % default is .95
\usepackage[.95]{helvet}
\usepackage[0.95]{helvet}
```

5.2.2 Option list parsing with package `kvoptions-patch`

With package `kvoptions-patch` the range of possible values in key value specifications is much large, for example the comma can be used, if enclosed in curly braces.

Other packages, especially the packages that uses their own process option code can be surprised to find tokens inside options that they do not expect and errors would be the consequence. To avoid errors the options, especially the unused option list is sanitized. That means the list will only contain tokens with catcode 12 (other) and perhaps spaces (catcode 10). This allows a safe parsing for other packages. But a comma in the value part is no longer protected by curly braces because they have lost their special meaning. This is the price for compatibility.

Example:

```
\RequirePackage{kvoptions-patch}
\documentclass[a={a,b,c},b]{article}
\begin{document}
\end{document}
```

Result:

```
LaTeX Warning: Unused global option(s):
[a={a,c},b].
```

6 Implementation

6.1 Preamble

```
98 <*package>
```

Reload check and identification. Reload check, especially if the package is not used with L^AT_EX.

```
99 \begingroup

External resources. The package extends the support for key value pairs of package `\keyval` to package options. Thus the package needs to be loaded anyway. and we use it for `\SetupKeyvalOptions`. AFAIK this does not disturb users of `xkeyval`.

6.2 Option declaration macros

6.2.1 \SetupKeyvalOptions

The family for the key value pairs can be setup once and is remembered later. The package name seems a reasonable default for the family key, if it is not set by the package author.

`\KV0@family` We cannot store the family setting in one macro, because the package should be usable for many other packages, too. Thus we remember the family setting in a macro, whose name contains the package name with extension, a key in L^AT_EX's class/package system.

```

230 \define@key{KV0}{family}{%
231   \expandafter\edef\csname KV0@family@%
232     \@currname.\@current\endcsname{#1}%
233 }
234 \def\KV0@family{%
235   \ifundefined{KV0@family@\@currname.\@current}{%
236     \@currname
237   }{%
238     \csname KV0@family@\@currname.\@current\endcsname
239   }%
240 }
```

`\KV0@prefix` The value settings of options that are declared by `\DeclareBoolOption` and `\DeclareStringOption` need to be saved in macros. In the first case this is a switch `\if<prefix><key>`, in the latter case a macro `\<prefix><key>`. The prefix can be configured, by `prefix` that is declared here. The default is the package name with `@` appended.

```

241 \define@key{KV0}{prefix}{%
242   \expandafter\edef\csname KV0@prefix@%
243     \@currname.\@current\endcsname{#1}%
244 }
245 \def\KV0@prefix{%
246   \ifundefined{KV0@prefix@\@currname.\@current}{%
247     \@currname @%
248   }{%
249     \csname KV0@prefix@\@currname.\@current\endcsname
250   }%
251 }
```

`\SetupKeyvalOptions` The argument of `\SetupKeyvalOptions` expects a key value list, known keys are family and prefix.

```

252 \newcommand*\SetupKeyvalOptions{%
253   \setkeys{KV0}%
254 }
```

6.2.2 `\DeclareBoolOption`

`\DeclareBoolOption` Usually options of boolean type can be given by the user without value and this means a setting to *true*. We follow this convention here. Also it simplifies the user interface.

The switch is created and initialized with *false*. The default setting can be overwritten by the optional argument.

L^AT_EX's `\newif` does not check for already defined macros, therefore we add this check here to prevent the user from accidentally redefining of T_EX's primitives and other macros.

```

255 \newcommand*\DeclareBoolOption}[2][false]{%
256   \KV0@ifdefinable{if\KV0@prefix#2}{%
257     \KV0@ifdefinable{\KV0@prefix#2true}{%
258       \KV0@ifdefinable{\KV0@prefix#2false}{%
259         \csname newif\expandafter\endcsname
260         \csname if\KV0@prefix#2\endcsname
261         \ifundefined{KV0@prefix#2#1}{%
262           \PackageWarning{kvoptions}{%
263             Initialization of option ‘#2’ failed,\MessageBreak
264             cannot set boolean option to ‘#1’,\MessageBreak
265             use ‘true’ or ‘false’, now using ‘false’%

```

```

266     }%
267   }{%
268     \csname\KV0@prefix#2#1\endcsname
269   }%
270   \begingroup
271     \edef\x{\endgroup
272       \noexpand\define@key{\KV0@family}{#2}[true]{%
273         \noexpand\KV0@boolkey{\@currname}%
274         \ifx\@current\@clsextension
275           \noexpand\@clsextension
276         \else
277           \noexpand\@pkgextension
278         \fi
279         {\KV0@prefix}{#2}{####1}%
280       }%
281     }%
282   \x
283 }%
284 }%
285 }%
286 }

```

`\DeclareComplementaryOption` The first argument is the key name, the second the key that must be a boolean option with the same current family and prefix. A new switch is not created for the new key, we have already a switch. Instead we define switch setting commands to work on the parent switch.

```

287 \newcommand*{\DeclareComplementaryOption}[2]{%
288   \@ifundefined{if\KV0@prefix#2}{%
289     \PackageError{kvoptions}{%
290       Cannot generate option code for ‘#1’,\MessageBreak
291       parent switch ‘#2’ does not exist%
292     }{%
293       You are inside %
294       \ifx\@current\@clsextension class\else package\fi\space
295       ‘\@currname.\@current’.\MessageBreak
296       ‘\KV0@family’ is used as family %
297       for the keyval options.\MessageBreak
298       ‘\KV0@prefix’ serves as prefix %
299       for internal switch macros.\MessageBreak
300       \MessageBreak
301     \@ehc
302   }%
303 }{%

8 Installation

8.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/kvoptions.dtx](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek/kvoptions.dtx) The source file.

[CTAN:macros/latex/contrib/oberdiek/kvoptions.pdf](https://ctan.org/ctan/packages/macros/latex/contrib/oberdiek/kvoptions.pdf) Documentation.

¹<http://ftp.ctan.org/tex-archive/>

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for T_EX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

8.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

8.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain-T_EX:

```
tex kvoptions.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>kvoptions.sty</code>	→ <code>tex/latex/oberdiek/kvoptions.sty</code>
<code>kvoptions-patch.sty</code>	→ <code>tex/latex/oberdiek/kvoptions-patch.sty</code>
<code>kvoptions.pdf</code>	→ <code>doc/latex/oberdiek/kvoptions.pdf</code>
<code>example-mycolorsetup.sty</code>	→ <code>doc/latex/oberdiek/example-mycolorsetup.sty</code>
<code>test/kvoptions-test1.tex</code>	→ <code>doc/latex/oberdiek/test/kvoptions-test1.tex</code>
<code>test/kvoptions-test2.tex</code>	→ <code>doc/latex/oberdiek/test/kvoptions-test2.tex</code>
<code>kvoptions.dtx</code>	→ <code>source/latex/oberdiek/kvoptions.dtx</code>

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

8.4 Refresh file name databases

If your T_EX distribution (teT_EX, mikT_EX, ...) relies on file name databases, you must refresh these. For example, teT_EX users run `texhash` or `mktextlsr`.

8.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk kvoptions.pdf unpack_files output .
```

Unpacking with \LaTeX . The `.dtx` chooses its action depending on the format:

plain- \TeX : Run `docstrip` and extract the files.

\LaTeX : Generate the documentation.

If you insist on using \LaTeX for `docstrip` (really, `docstrip` does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{kvoptions.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdf \LaTeX :

```
pdflatex kvoptions.dtx
makeindex -s gind.ist kvoptions.idx
pdflatex kvoptions.dtx
makeindex -s gind.ist kvoptions.idx
pdflatex kvoptions.dtx
```

10 History

[0000/00/00 v0.0]

- Probably David Carlisle's code in `hyperref` was the start.

[2004/02/22 v1.0]

- The first version was never published. It also has offered a patch to get rid of L^AT_EX's option expansion.

[2006/02/16 v2.0]

- Now the package is redesigned with an easier user interface.
- `\ProcessKeyvalOptions` remains the central service, inherited from `hyperref`'s `\ProcessOptionsWithKV`. Now the use inside classes is also supported.
- Provides help macros for boolean and simple string options.
- Fixes for the patch of L^AT_EX. The patch is only enabled, if the user requests it.

[2006/02/20 v2.1]

- Unused option list is sanitized to prevent problems with other packages that uses own processing methods for key value options. Disadvantage: the unused global option detection is weakened.
- New option type by `\DeclareVoidOption` for options without value.
- Default rule by `\DeclareDefaultOption`.
- Dynamic options: `\DisableKeyvalOption`.

[2006/06/01 v2.2]

- Fixes for option patch.

[2006/08/17 v2.3]

- `\DeclareBooleanOption` renamed to `\DeclareBoolOption` to avoid a name clash with package `\ifoption`.

[2006/08/22 v2.4]

- Option patch: `\ExecuteOptions` does not change the meaning of macro `\CurrentOption` at all.

[2007/04/11 v2.5]

- Line ends sanitized.

[2007/05/06 v2.6]

- Uses package `etexcmds`.

[2007/06/11 v2.7]

- The patch part fixes LaTeX bug latex/3965.

[2007/10/02 v2.8]

- Compatibility for plain-T_EX added.
- Typos in documentation fixed (Axel Sommerfeldt).

[2007/10/11 v2.9]

- Bug fix for option patch.

[2007/10/18 v3.0]

- New package kvoptions-patch.

[2009/04/10 v3.1]

- Space by line end removed in definition of internal macro.

11 Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
